

docker network cve82078_lab 172.30.77.0/24 --internal (Internal = true)

no default route in any container · installer + first boot under RUN --network=none · 0 egress errors in vendor logs

Attacker = bridge
gateway .1
exploit script +
listener :4444

Arm A — STOCK
25.0.11.75758
172.30.77.20
VULNERABLE
(chain fires)

Arm B — EPR3
25.0.12-PO-4560.76533
172.30.77.40
dies at step 3/11

Arm C — MR
25.0.13.76605
172.30.77.30
dies at step 3/11

each arm: pc-app JVM (bundled Corretto 21), service user papercut, HTTP :9191

single variable across arms = installer build only (S-A0...S-A4 conditions identical)

chain uses ZERO credentials — the fictional lab admin account is never touched

*evidence channel (host-side docker exec: marker file, COLD tbl_config, process snapshots) is not an attack path
proves: no route to any arm but one HTTP port on a network with no exit; each arm is a byte-proven stock vendor installer*
